Statistical Analysis of Neoplastic and Non-neoplastic Lesions (Terminal Sacrifice)

1. Objectives

1.1 Project Objectives

The goal of this study is to study the long term toxicity of orally administered Bisphenol-A (BPA) over a broad dose range.

1.2 Analysis Objectives

The objective of this analysis is to determine the effects on histopathology of a broad range of continuous and stop doses of BPA after two years. Statistical analyses of data from continuous doses of the reference estrogen EE₂ are also presented.

2. Experimental Design

The study design consisted of first generation female and male rats (F₀) for up to 600 mating pairs randomized to treatment groups in 5 loads. The goal of the F₀ matings was to obtain 352 study litters, 50 per dose group for vehicle controls and five BPA dose groups, 2.5, 25, 250, 2500, and 25000 µg/kg bw/day, and 26 for each of two EE₂ dose groups, 0.05 and 0.5 µg/kg bw/day. Dams were dosed daily from gestation day (GD) 6 until parturition. Dosing was by gavage for F₀ dams and F₁ pups, the second study generation. Litters were culled to 10 pups on PND 1. There were two study dosing arms of F₁ animals, daily continuous dosing to termination, and daily dose stopped at post-natal day (PND) 21. There was a vehicle control group and five BPA groups (2.5, 25, 250, 2500, and 25000 µg/kg) for each study dosing arm, and EE₂ daily dose groups (0.05 and 0.50 µg/kg) for the continuous dosing arm only. From the F₁ litters, pups were allocated at weaning, PND 21, to the Terminal (1 year) and terminal (2 year) sacrifices for the core study. For vehicle and BPA terminal sacrifice groups, there were 50 pups each; for the Terminal sacrifice and the EE₂ terminal sacrifice groups, there were 20-26 pups each. Pups within litter and sex were assigned to different dosing arms and sacrifice times.

3. Statistical Methods

Statistical analyses were performed separately for the BPA study arms, stop dose and continuous dose, and for the EE₂ continuous dose.

For neoplasm and non-neoplasm incidence, the poly-3 age-adjusted test (Bailer & Portier, 1988) with variance correction (Bieler & Williams, 1993) and the NIEHS continuity-correction (Peddada & Kissling, 2006) was used to test for linear dose trend and to compare dosed groups to the vehicle control.

In addition, non-neoplastic lesion severity is available for many of the lesions found. Therefore, the Jonckheere-Terpstra test (Jonckheere (1954) and Terpstra (1952)) was run to test for monotonic dose trend, followed by Shirley's test (Shirley, 1977 and Williams, 1986) to compare

treated groups to controls. This combination of tests will be referred to as JT/SW. JT/SW presumes a monotonic dose response. Part of the purpose of this study is to consider potential low-dose effects, especially in the low BPA analysis. JT/SW is blind to this effect. Therefore, the nonparametric relative effects method [RTE] (Brunner, Domhof, Langer, 2002) was used to test for non-monotonic effects. This method can account for severity and does allow for trend tests and contrasts. The RTE test (as well as JT/SW) can be very sensitive to small differences in severity.

Lesions with an incidence of four or more in any treatment group (or two or more for an EE₂ group) were included in each analysis. The tests for the comparisons to vehicle are one-sided while the trend tests are two-sided. No adjustments are made for multiplicity.

For analysis of each endpoint, a sensitivity analysis was also performed. During initial preweaning of animals, 263 core study 2 year terminal sacrifice animals (56 in vehicle control, 175 in BPA 2.5, 25, 250, 2500, and 25000 µg/kg bw/day, and 32 in EE₂ µg/kg bw/day dose groups) were held in the same rooms as a special BPA 250,000 µg/kg bw/day high dose requested by an academic laboratory. In consultation with the Principal Investigator, to address the possibility of inadvertent exposure of the core study animals, a sensitivity analysis excluding these 263 animals was also performed to test the robustness of the results. Additional statistically significant pairwise comparisons from the sensitivity analysis are reported in the text.

4. Results

Tables are included in Appendix A1. Generally, simple incidence refers to all animals for which the given tissue was microscopically examined, poly-k incidence refers to the number of animals with lesions as a proportion of the number of mortality-adjusted animals examined, terminal incidence refers to animals which survived to scheduled sacrifice, time-to-first indicates the number of study days of the earliest observance of the lesion, and severity profile summarizes the number of animals with minimal, mild, moderate, and marked lesion severity.

For females, there were 602 lesions assessed in 31 tissues examined. For males, 631 lesions were assessed in 33 tissues examined.

The results of poly-3 analysis of lesion incidence and RTE analysis are discussed below. Results of JT/SW are presented in the tables for reference, but are not discussed.

4.1 BPA Treatments Stop Dose Arm

Results of the poly-3 analysis of neoplasms for the comparison of BPA to vehicle control for the stop dose arm are given in Tables 1 (females) and 2 (males). For females, there was a significantly greater incidence of mammary gland adenocarcinoma, and adenocarcinoma or adenoma, for the stop dose 2.5 µg/kg BPA group ($p=0.016$ and $p=0.018$, respectively) compared to the vehicle control group. For stop dose males, there was a significant ($p=0.008$) BPA linear trend for liver malignant lymphoma, although no BPA treated group was significantly different from the control. Similarly, there was a significant linear dose trend for malignant lymphoma of

the dorsal/lateral lobe prostate ($p=0.002$), bone marrow ($p=0.005$), spleen ($p=0.009$), and the kidney ($p=0.007$), with a significantly higher incidence in the dorsal/lateral lobe prostate for the 25,000 $\mu\text{g}/\text{kg}$ BPA group ($p=0.038$).

Results of the poly-3 analysis of non-neoplasms for the comparison of BPA to vehicle control for the stop dose arm are given in Tables 7 (females) and 8 (males). For females, there was a significantly greater incidence of liver lipidosis tension for the 2.5 $\mu\text{g}/\text{kg}$ BPA group ($p=0.019$) and the 250 $\mu\text{g}/\text{kg}$ BPA group ($p=0.032$) compared to the vehicle control group. There was a significantly greater incidence of thyroid gland ultimobranchial cyst in the 250 $\mu\text{g}/\text{kg}$ BPA group ($p=0.038$) and in the 2500 $\mu\text{g}/\text{kg}$ BPA group ($p=0.017$) compared to controls. There was a significantly greater incidence of kidney renal tubule cyst in the 2.5 $\mu\text{g}/\text{kg}$ BPA group ($p=0.036$) compared to controls. There was an additional significant dose trend for incidence of liver cystic degeneration ($p=0.007$). In addition, the RTE test for differences in severity was significant for liver cystic degeneration at 2500 $\mu\text{g}/\text{kg}$ ($p=0.014$) and at 25,000 $\mu\text{g}/\text{kg}$ ($p=0.042$), liver mineralization at 2.5 $\mu\text{g}/\text{kg}$ ($p=0.015$), liver lipidosis tension at 25,000 $\mu\text{g}/\text{kg}$ ($p=0.030$), heart cardiomyopathy at 2.5 ($p=0.043$), 250 ($p=0.034$), 2500 ($p=0.024$), and 25,000 $\mu\text{g}/\text{kg}$ ($p=0.004$), adrenal cortex hypertrophy at 25,000 $\mu\text{g}/\text{kg}$ ($p=0.011$), pituitary gland pars distalis hyperplasia at 2.5 $\mu\text{g}/\text{kg}$ ($p=0.023$) and 25 $\mu\text{g}/\text{kg}$ ($p=0.020$), uterus endometrium cystic hyperplasia at 2500 $\mu\text{g}/\text{kg}$ ($p=0.014$), thymus atrophy at 25 at $\mu\text{g}/\text{kg}$ ($p=0.038$) and 2500 $\mu\text{g}/\text{kg}$ ($p=0.039$), and kidney nephropathy at 25,000 $\mu\text{g}/\text{kg}$ ($p=0.041$). Additional BPA dose trends for severity were significant for heart cardiomyopathy ($p=0.007$), adrenal cortex hypertrophy ($p=0.032$), uterus endometrium cystic hyperplasia ($p=0.023$), and kidney nephropathy ($p=0.006$).

For males, there was a significantly greater incidence of pancreas pigmentation for the 2.5 $\mu\text{g}/\text{kg}$ BPA group ($p=0.018$), pancreas polyarteritis for the 2500 $\mu\text{g}/\text{kg}$ group ($p=0.035$), adrenal medulla hyperplasia for the 2500 $\mu\text{g}/\text{kg}$ group ($p=0.030$), pituitary gland pars distalis cyst for the 250 $\mu\text{g}/\text{kg}$ group ($p=0.047$), pituitary gland pars distalis hyperplasia for the 25,000 $\mu\text{g}/\text{kg}$ group ($p=0.020$), testes polyarteritis for the 2500 $\mu\text{g}/\text{kg}$ group ($p=0.038$), bone marrow hypocellularity for the 250 $\mu\text{g}/\text{kg}$ group ($p=0.046$) and for the 25,000 $\mu\text{g}/\text{kg}$ group ($p=0.035$), and spleen lymphoid hyperplasia for the 250 $\mu\text{g}/\text{kg}$ group ($p=0.039$). BPA dose trends for incidence were significant for pancreas polyarteritis ($p=0.013$), heart cardiomyopathy ($p=0.022$), adrenal medulla hyperplasia ($p=0.016$), parathyroid gland hyperplasia ($p=0.018$), pituitary gland pars distalis hyperplasia ($p=0.018$), testes polyarteritis ($p=0.012$), spleen lymphoid hyperplasia ($p=0.026$), kidney renal tubule cyst ($p=0.012$), and kidney transitional epithelium hyperplasia ($p=0.043$). In addition, the RTE test for differences in severity was significant for liver angiectasis at 25 $\mu\text{g}/\text{kg}$ ($p=0.047$), coagulating gland atrophy at 25 $\mu\text{g}/\text{kg}$ ($p=0.040$), and spleen lymphoid hyperplasia at 2500 $\mu\text{g}/\text{kg}$ ($p=0.039$).

4.2 BPA Treatments Continuous Dose Arm

Results of the poly-3 analysis of neoplasms for the comparison of BPA to vehicle control for the continuous dose arm are given in Tables 3 (females) and 4 (males). There was no statistically different incidence of neoplasms for any BPA group for either females or males.

Results of the analysis of non-neoplasms for the comparison of BPA to vehicle control for the continuous dose arm are given in Tables 9 (females) and 10 (males). For females, there was a significantly greater incidence of vagina epithelium degeneration for the 2500 µg/kg BPA group ($p=0.038$) compared to the vehicle control group. There was a significantly greater incidence of vagina epithelium hyperplasia in the 25 µg/kg group ($p=0.014$), the 2500 µg/kg group ($p=0.026$), and the 25,000 µg/kg group ($p=0.026$) compared to controls. There was a significantly greater incidence of kidney nephropathy in the 2.5 µg/kg BPA group ($p=0.033$). There was a significant BPA dose trend for uterus lumen dilatation ($p=0.020$), vagina epithelium hyperplasia ($p=0.006$), and thymus atrophy ($p=0.016$). In addition, the RTE test for differences in severity was significant for liver angiectasis at 25,000 µg/kg ($p=0.040$), thyroid gland follicular cell hyperplasia at 2.5 µg/kg ($p=0.015$), vagina epithelium degeneration at 2.5 µg/kg ($p=0.022$), bone marrow hypocellularity at 25,000 µg/kg ($p=0.035$), mammary gland atypical focus at 2.5 µg/kg ($p=0.024$), and kidney nephropathy at 25,000 µg/kg ($p=0.027$). There was an additional significant trend for lung histiocyte cellular infiltration ($p=0.042$).

For males, there was a significantly greater incidence of liver angiectasis for the 2.5 µg/kg BPA group ($p=0.016$) compared to the vehicle control group. There was a significantly greater incidence of parathyroid gland hyperplasia for the 25 µg/kg group ($p=0.004$), of pituitary gland pars distalis hyperplasia for the 25,000 µg/kg group ($p=0.022$), and of thyroid gland c-cell hyperplasia for the 2500 µg/kg group ($p=0.003$), compared to controls. There was a significantly greater incidence of dorsal/lateral lobe prostate suppurative inflammation for the 2.5 µg/kg group ($p=0.027$), and of mammary gland alveolus dilatation for the 2.5 µg/kg group ($p=0.028$). There was a significantly greater incidence of kidney renal tubule cyst for the 250 µg/kg group ($p=0.024$) and for the 2500 µg/kg group ($p=0.033$), and of kidney transitional epithelium hyperplasia for the 25 µg/kg group ($p=0.006$), compared to controls. There was a significant BPA dose trend for pituitary gland pars distalis multilocular cyst ($p=0.007$), for pituitary gland pars distalis hyperplasia ($p=0.005$), and for thyroid gland c-cell hyperplasia ($p=0.039$). In addition, the RTE test for differences in severity was significant for liver lipidosis tension at 25,000 µg/kg ($p=0.025$), parathyroid gland hyperplasia at 250 µg/kg ($p=0.039$), pituitary gland pars distalis hyperplasia for the 25 µg/kg group ($p=0.043$), thyroid gland follicular cell hyperplasia at 25 µg/kg ($p=0.015$), epididymis polyarteritis at 2500 µg/kg ($p=0.013$), ventral lobe prostate epithelium hyperplasia at 250 µg/kg ($p=0.027$), kidney mineralization at 250 µg/kg ($p=0.035$), and for kidney nephropathy at 2500 µg/kg ($p=0.045$). There was a significant severity trend, based on the RTE test, for adrenal cortex hypertrophy ($p=0.046$).

4.3 EE₂ Treatments Continuous Dose Arm

Results of the poly-3 analysis of neoplasms for the comparison of EE₂ to vehicle control for the continuous dose arm are given in Tables 5 (females) and 6 (males). For females, there was a significantly greater incidence of mammary gland adenocarcinoma for the 0.5 µg/kg EE₂ group ($p<0.001$) compared to the vehicle control group. There were significant EE₂ dose trends for adrenal medulla benign pheochromocytoma ($p=0.048$) and thyroid gland c-cell adenoma ($p=0.036$), as well as for mammary gland adenocarcinoma ($p<0.001$). There was no statistically different incidence of neoplasms for either EE₂ group for males.

Results of the analysis of non-neoplasms for the comparison of EE₂ to vehicle control for the continuous dose arm are given in Tables 11 (females) and 12 (males). For females, based on the poly-3 tests, there was a significantly greater incidence of lesions compared to the 0.50 µg/kg EE₂ group for liver lipidosis tension for ($p=0.026$), adrenal cortex cystic degeneration ($p=0.017$), pituitary gland angiectasis ($p<0.001$), pituitary gland hemorrhage ($p=0.023$), uterus atrophy ($p=0.033$), spleen pigmentation ($p<0.001$), mammary gland alveolus dilatation ($p<0.001$), mammary gland duct dilatation ($p<0.001$), brain stem compression ($p<0.001$), and brain stem hemorrhage ($p=0.009$), for the 0.5 µg/kg EE₂ group compared to the vehicle control group. There was a significantly greater incidence of liver cytoplasmic vacuolization ($p=0.031$), thyroid gland follicular cell hyperplasia ($p=0.034$), uterus endometrium hyperplasia ($p=0.040$), and kidney cortex cyst ($p=0.045$) in the 0.05 µg/kg EE₂ group compared to controls. There was an additional significant dose trend for liver basophilic focus ($p=0.036$), pancreas acinar cell hyperplasia ($p=0.038$), adrenal cortex pigmentation (0.038), thyroid gland ultimobranchial cyst ($p=0.048$), ovary cyst ($p=0.049$), ovary bursa cyst ($p=0.049$), uterus endometrium cyst ($p=0.038$), uterus squamous metaplasia ($p=0.046$), bone marrow myeloid hyperplasia ($p=0.038$), and mammary gland galactocele ($p=0.038$). In addition, the RTE test for differences in severity was significant for pancreas acinar cell hyperplasia at 0.5 µg/kg ($p=0.032$), heart cardiomyopathy at 0.5 µg/kg ($p=0.035$), adrenal cortex angiectasis at 0.5 µg/kg ($p=0.024$), adrenal cortex pigmentation at 0.5 µg/kg ($p=0.032$), adrenal medulla hyperplasia at 0.5 µg/kg ($p=0.044$), ovary atrophy at 0.5 µg/kg ($p<0.001$), vagina atrophy at 0.5 µg/kg ($p=0.035$), bone marrow myeloid cell hyperplasia at 0.5 µg/kg ($p=0.032$), brain cerebrum ventricle dilatation at 0.5 µg/kg ($p=0.035$), and kidney nephropathy at 0.05 µg/kg ($p=0.006$).

For males, there was a significantly greater incidence for the 0.5 µg/kg EE₂ group of liver cytoplasmic vacuolization ($p=0.037$), and pituitary gland pars distalis hyperplasia ($p=0.027$), compared to the vehicle control group. There was a significantly greater incidence for the 0.05 µg/kg EE₂ group of adrenal cortex hypertrophy ($p=0.005$), thyroid gland c-cell hyperplasia ($p=0.009$), and kidney renal tubule cyst ($p=0.002$), compared to the vehicle control group. There was an additional dose trend for heart osseous metaplasia ($p=0.049$). In addition, the RTE test for differences in severity was significant for parathyroid gland hyperplasia at 0.5 µg/kg ($p=0.029$) and epididymis cellular lymphocyte infiltration at 0.5 µg/kg ($p=0.045$).

4.4 Sensitivity Analysis

The results of the sensitivity analysis, excluding animals housed in the same room as animals exposed to BPA 250,000 µg/kg bw/day high dose, produced results very similar to the full analysis. There were a few significant results observed in the full analysis which were not observed in the sensitivity analysis, presumably due to the lesser statistical power of the data subset.

For stop dose females, there was a significant BPA dose trend for liver mixed cell focus ($p=0.036$) which was not significant in the full analysis. There was a significant poly-3 ($p=0.049$) difference in heart cardiomyopathy for stop dose females in the 25,000 µg/kg BPA group (27/30.8) compared to controls (22/31.6); a nonsignificant difference for the full analysis where 35 of 39.7 poly-3 adjusted animals had the lesion in the BPA group compared to 32 of 42.9 in the control group. There was a significant poly-3 ($p=0.025$) difference in adrenal cortex

hyperplasia for stop dose females in the 25,000 µg/kg BPA group (7/24.8) compared to controls (1/23.6); a nonsignificant difference for the full analysis where 7 of 32.6 poly-3 animals had the lesion in the BPA group compared to 3 of 31.8 in the control group. There was a significant poly-3 ($p=0.038$) difference in uterus endometrium cystic hyperplasia for stop dose females in the 2500 µg/kg BPA group (23/34.3) compared to controls (12/28.2); a nonsignificant difference for the full analysis where 28 of 42.5 animals had the lesion in the BPA group compared to 18 of 38.3 in the control group. There was a significant ($p=0.029$) BPA dose trend for vagina poly morphonuclear cellular infiltration which was nonsignificant in the full analysis.

For stop dose males there was a significant ($p=0.048$) BPA dose trend for pituitary gland pars distalis cyst which was nonsignificant in the full analysis. There was a significant poly-3 ($p=0.041$) difference in pituitary gland pars distalis hypertrophy for stop dose males in the 25,000 µg/kg BPA group (4/21.7) compared to controls (0/24.3); a nonsignificant difference for the full analysis where 4 of 28.5 poly-3 adjusted animals had the lesion in the BPA group compared to 1 of 35.1 in the control group. There was a significant poly-3 ($p=0.046$) difference in epididymis exfoliated germ cell for stop dose males in the 2500 µg/kg BPA group (16/32.4) compared to controls (7/27.3); a nonsignificant difference for the full analysis where 17 of 39.8 poly-3 adjusted animals had the lesion in the BPA group compared to 12 of 39.0 in the control group.

There was a significant poly-3 ($p=0.027$) difference in pituitary gland pars distalis hyperplasia for continuous dose females in the 25 µg/kg BPA group (30/37.0) compared to controls (18/30.8); a nonsignificant difference for the full analysis where 32 of 40.6 poly-3 animals had the lesion in the BPA group compared to 27 of 43.6 in the control group. There was a significant poly-3 ($p=0.035$) difference in uterus lumen dilatation for continuous dose females in the 25,000 µg/kg BPA group (5/26.8) compared to controls (0/24.0); a nonsignificant difference for the full analysis where 6 of 33.0 animals had the lesion in the BPA group compared to 2 of 35.6 in the control group. There was a significant ($p=0.033$) poly-3 difference in kidney renal tubule cyst for continuous dose females in the 250 µg/kg BPA group (15/32.9) compared to controls (5/24.8); a nonsignificant difference for the full analysis where 15 of 36.1 animals had the lesion in the BPA group compared to 9 of 36.2 in the control group.

There was a significant ($p=0.045$) poly-3 BPA dose trend in adrenal medulla hyperplasia for continuous dose males. There was a significant ($p=0.040$) poly-3 difference in testes polyarteritis for continuous dose males in the 25 µg/kg BPA group (16/30.7) compared to controls (7/25.9); a nonsignificant difference for the full analysis where 16 of 34.8 poly-3 animals had the lesion in the BPA group compared to 12 of 35.2 in the control group; a significant ($p=0.020$) difference in the 250 µg/kg BPA group (19/34.4) compared to controls (7/25.9); a nonsignificant difference for the full analysis where 20 of 37.8 animals had the lesion in the BPA group compared to 12 of 35.2 in the control group; and a significant ($p=0.47$) dose trend which was nonsignificant in the full analysis.

There was a significant ($p=0.029$) poly-3 difference in adrenal cortex angiectasis for continuous dose females in the 0.5 µg/kg EE₂ group (7/11.9) compared to controls (6/25.7); a nonsignificant difference for the full analysis where 9 of 18.7 poly-3 animals had the lesion in the BPA group compared to 9 of 37.3 in the control group. There was a significant ($p=0.013$) poly-3 difference

(and significant dose trend; $p=0.008$) in uterus lumen dilatation for continuous dose females in the $0.5 \mu\text{g}/\text{kg}$ EE₂ group (3/10.5) compared to controls (0/24.0); a nonsignificant difference for the full analysis where 3 of 16.0 animals had the lesion in the BPA group compared to 2 of 35.6 in the control group.

There was a significant ($p=0.046$) EE₂ dose trend for males regarding parathyroid gland hyperplasia. There was a significant ($p=0.042$) poly-3 difference in pituitary gland angiectasis for continuous dose males in the $0.05 \mu\text{g}/\text{kg}$ EE₂ group (5/14.2) compared to controls (2/24.2); a nonsignificant difference for the full analysis where 7 of 19.1 animals had the lesion in the BPA group compared to 6 of 33.5 in the control group.

5. Conclusions

For females, there was a significantly ($p=0.016$) greater incidence of mammary gland adenocarcinoma for the stop dose $2.5 \mu\text{g}/\text{kg}$ BPA group (poly-3 adjusted incidence of 11/33.3 or 33.0%) compared to the vehicle control group (poly-3 incidence of 3/32.3 or 9.3%). There is no significant dose difference compared to controls for animals continuously dosed with BPA.

For males, there was a significantly ($p=0.038$) greater incidence of dorsal/lateral lobe prostate malignant lymphoma for the stop dose $25,000 \mu\text{g}/\text{kg}$ BPA group (poly-3 adjusted incidence of 4/29.1 or 13.8%) compared to the vehicle control group (poly-3 incidence of 0/35.1 or 0.0%). In addition, there is a significant dose trend for malignant lymphoma of the liver, the dorsal/lateral lobe prostate, bone marrow, spleen, and kidney. However, the incidence of malignant lymphoma never exceeds five (16.8%) for any tissue in any treatment group. There is no significant dose difference for malignant lymphoma compared to controls for animals continuously dosed with BPA.

For females, there was a significantly ($p<0.001$) greater incidence of mammary gland adenocarcinoma for the continuous dose $0.5 \mu\text{g}/\text{kg}$ EE₂ group (poly-3 incidence of 10/17.6 or 56.9%) compared to the vehicle control group (poly-3 incidence of 4/34.4 or 11.6%). For EE₂ treated males, there was no lesion with significantly greater incidence than for vehicle controls.

There were a number of significantly greater incidences of non-neoplasms for various BPA dose groups compared to controls, for both females and males, none of which were repeated across treatment arms nor consistent across dose groups.

For females, based on the poly-3 tests, there was a significantly greater incidence of lesions compared to the $0.50 \mu\text{g}/\text{kg}$ EE₂ group for liver lipidosis tension for ($p=0.026$), adrenal cortex cystic degeneration ($p=0.017$), pituitary gland angiectasis ($p<0.001$), pituitary gland hemorrhage ($p=0.023$), uterus atrophy ($p=0.033$), spleen pigmentation ($p<0.001$), mammary gland alveolus dilatation ($p<0.001$), mammary gland duct dilatation ($p<0.001$), brain stem compression ($p<0.001$), brain stem hemorrhage ($p=0.009$), and kidney nephropathy ($p=0.025$) for the $0.5 \mu\text{g}/\text{kg}$ EE₂ group compared to the vehicle control group. There was a significantly greater incidence of thyroid gland follicular cell hyperplasia ($p=0.007$) uterus endometrium hyperplasia ($p=0.040$), and kidney cortex cyst ($p=0.045$) in the $0.05 \mu\text{g}/\text{kg}$ EE₂ group compared to controls.

For males, there was a significantly greater incidence for the 0.5 µg/kg EE₂ group of liver cytoplasmic vacuolization ($p=0.037$), and pituitary gland pars distalis hyperplasia ($p=0.027$), compared to the vehicle control group. There was a significantly greater incidence for the 0.05 µg/kg EE₂ group of adrenal cortex hypertrophy ($p=0.005$), thyroid gland c-cell hyperplasia ($p=0.009$), and kidney renal tubule cyst ($p=0.002$), compared to the vehicle control group.

P-values for dose trend are presented in the “Control” column.

N indicates a negative trend or negative treatment comparison to control with corresponding lower-tail p-values.

¹ Nonsignificant SW test due to the assumption of monotonicity.

P-values for dose trend are presented in the “Control” column.

N indicates a negative trend or negative treatment comparison to control with corresponding lower-tail p-values.

¹ Nonsignificant SW test due to the assumption of monotonicity.

P-values for dose trend are presented in the "Control" column.

N indicates a negative trend or negative treatment comparison to control with corresponding lower-tail p-values.

¹ Nonsignificant SW test due to the assumption of monotonicity.

P-values for dose trend are presented in the "Control" column.

N indicates a negative trend or negative treatment comparison to control with corresponding lower-tail p-values.

¹ Nonsignificant SW test due to the assumption of monotonicity.

P-values for dose trend are presented in the “Control” column.

N indicates a negative trend or negative treatment comparison to control with corresponding lower-tail p-values.

¹ Nonsignificant SW test due to the assumption of monotonicity.

P-values for dose trend are presented in the "Control" column.

N indicates a negative trend or negative treatment comparison to control with corresponding lower-tail p-values.

¹ Nonsignificant SW test due to the assumption of monotonicity.
