

ADME NTP Study S0231 2,4,7-Trinitro-fluoren-9-one

The contract laboratory abbreviation is TNF.

Sex/Species: adult female F344 rats.

Vehicles: intravenous, dimethyl sulfoxide (DMSO):serum (1:3), oral, corn oil; dermal, acetone; intraintestinal, DMSO:serum (1:3).

CASRN 129-79-3

Radiolabeled with carbon-14 at the carbonyl carbon; 2,4,7-Trinitro[9-¹⁴C]fluorenone

Studies performed:

1. Single 47 µg/2 cm² dermal dose in rats with covered dose site and sacrifice 24 hours postdose. (Mean body weight and standard deviation is 135 ± 5 g; n=4, 2 cm² dose area).
2. Single 400 µg/2 cm² dermal dose in rats with covered dose site and sacrifice 72 hours postdose. (Mean body weight and standard deviation is 128 ± 4 g; n=4, 2 cm² dose area).
3. Single 1, 10, or 100 mg/kg oral gavage dose in rats with sacrifice 72 hours postdose.
4. Single 1 mg/kg intravenous dose in rats with sacrifice 72 hours postdose.
5. Single 1 mg/kg intravenous dose in rats with bile collected to 6 hours postdose.
6. Single 1 mg/kg intraintestinal dose with bile collected to 6 hours postdose.
7. Single 10 mg/kg oral gavage dose to control animals and those pretreated with lincomycin/neomycin designed to determine the contribution of gut flora to the disposition of TNF. Rats were sacrificed at 6 hours.

The intraintestinal dose for the bile cannulation study was administered into the proximal end of the small intestine, approximately 1-2 cm south of the pyloris.

For Table 4, the original heading had a concentration value of 400 mg/2 cm² which was contradicted in multiple places in the report text. This value has been corrected to 400 µg/2 cm².
