

Hypothesis test results for analysis of estrous cyclicity using the continuous-time Markov model

Stage ^a	Comparison ^b	p-value ^c	Significance ^d	Stage Length Difference ^e (days)
Diestrus	Low-Control	1.000	None	-0.4
Diestrus	Mid-Control	1.000	None	-0.2
Diestrus	High-Control	0.277	None	-0.7
Estrus	Low-Control	0.738	None	0.2
Estrus	Mid-Control	0.800	None	0.2
Estrus	High-Control	0.879	None	0.2
Metestrus	Low-Control	1.000	None	0.1
Metestrus	Mid-Control	1.000	None	0.0
Metestrus	High-Control	0.454	None	0.2

a: Insufficient data to evaluate proestrus stage.

b: Sample sizes for the Control, Low, Mid, and High dose groups respectively were $n = 10, 10, 10, 10$.
Dose levels were 0, 1, 3, 6 mg/mL respectively.

c: The p-values shown were calculated using a permutation null hypothesis testing method and have been adjusted for multiple comparisons using a Hommel correction within each stage.

d: Significance is based on the adjusted p-value with a significance level of $\alpha = 0.05$.

e: A positive number indicates the estimated stage length in the treated group is longer than in the control group.

Markov model estimates of stage length and 95% confidence intervals

	Control (0 mg/mL)		Low dose (1.0 mg/mL)		Mid dose (3.0 mg/mL)		High dose (6.0 mg/mL)	
	Stage Length (days)	95% CI	Stage Length (days)	95% CI	Stage Length (days)	95% CI	Stage Length (days)	95% CI
Diestrus	2.4	(1.9, 3.0)	2.0	(1.6, 2.7)	2.3	(1.7, 3.2)	1.8	(1.6, 2.0)
Proestrus ^a	0.1	--	0.1	--	0.1	--	0.1	--
Estrus	1.1	(1.0, 1.2)	1.3	(1.1, 1.5)	1.3	(1.1, 1.5)	1.3	(1.1, 1.6)
Metestrus	0.2	(0.1, 0.4)	0.3	(0.2, 0.5)	0.2	(0.1, 0.3)	0.4	(0.3, 0.5)

a: Due to a very low number of observations of proestrus, stage lengths were estimated using a profile likelihood approach. As a result, confidence intervals are not available for the proestrus stage length estimate.

Estimates of stage length shown as dots, with bars indicating 95% confidence intervals. Estimates for lengths of proestrus are not shown here due to very low numbers of observations of this stage.
