</tbody>
</table>

\(^1\) For each animal, the observed post-weaning body weight was compared to the predicted body weight using a 5-point running median smoother and nearest neighbor interpolation.

\(^2\) The threshold for outlier exclusion was a difference between the observed and predicted weights greater than 35 with graphical confirmation for week 4.

</tbody>
</table>

\(^1\) For each animal, the observed post-weaning body weight was compared to the predicted body weight using a 5-point running median smoother and nearest neighbor interpolation.

\(^2\) The threshold for outlier exclusion was a difference between the observed and predicted weights greater than 35 (g) with graphical confirmation for week 4 due to rapid early post-weaning growth.
